Additional Herbicide Information:

Note: Landowners are responsible for following herbicide labels, wearing personal protective equipment, and following state & federal laws when applying herbicides; ISN can help interpret labels, but is not responsible for landowner actions.

Good Work Practices adapted from the National Pesticide Applicator Certification Core Manual, 2014 Edition

Proper use and selection of personal protective equipment (PPE) is essential for prevention of pesticide exposures. The PPE items selected for a particular pesticide application depend on the application procedure, the pesticide being applied, and the label requirements. Choose PPE items to protect the skin, eyes, and lungs from exposure. If there is a risk of pesticides penetrating clothing and contaminating skin, select items made of chemical-resistant materials such as plastics or rubber. Gloves, boots, aprons, suits, and hoods come in chemical-resistant materials such as plastics or rubber. Regular work clothes made of cotton, leather, or canvas are not chemically resistant.

Clean PPE after each use and wash separately from other clothing to prevent contamination. Dispose of PPE if it has cracks, holes, or rips, or is wearing thin in places. If PPE is contaminated by pesticides that cannot be removed by washing, dispose of it as hazardous waste. The label often specifies what type of protection to use.

Clean-up is an important part of personal protection. Immediately wash off any pesticide that gets directly on you, have spare clothing available, and shower at the end of pesticide use to minimize accidental exposure. Do not eat, drink, use the bathroom, or use tobacco products without first washing hands.

Pesticide storage and equipment clean-up should follow the label.
